Abstract (en)

[origin: EP2055358A1] The board has a lower layer forming a slider (2) that includes a groove (3) oriented parallelly to a median longitudinal axis (4) of the board. The groove forms a depression with respect to the rest of a plane of the bottom of the slide. The layer has an additional element whose shape partially corresponds to that of the groove, where the element forms a central portion of the layer. The additional element is made of material distinct from that of a main element, where the material possess weak frictional coefficient with respect to snow.
