Abstract (en)

[origin: EP2055860A1] A method and a covering kit for improving the sound dampening properties of a roof window is provided. The sound dampening is achieved by applying an adhesive tape to at least one member of a covering kit, which comprises a number of flashing, cladding and covering members and which is used for covering the exterior surfaces of the frame(s) and the joints between the roof surface and outer frame surfaces and between exterior frame surfaces and the pane. The adhesive tape can be applied to all sections of the covering kit members, which are substantially parallel to the pane in the mounted state and which are not covered by roofing material. Preferably to interior surfaces of the covering kit member(s). If the covering kit member(s) is made by deformation of a sheet material, the adhesive tape can be applied prior to deformation. Preferably over the entire length of the covering kit member(s).
