Abstract (en)  
[origin: EP2056337A2] An infrared light source has a filament (3) fabricated on a first substrate (1) in the shape of a microbridge and energizes the filament (3) so as to generate heat, thereby causing the filament (3) to emit infrared radiation. The infrared light source has a second substrate (2) that is bonded to the first substrate (1) and seals the filament (3), and feedthrough electrodes (9,10) that lead electrodes of the filament to the outside of the first substrate. Thereby, the function of the package is imparted to the device itself, to thus realize a highly-reliable device at low cost.
