Abstract (en)

[origin: EP2056625A2] The hearing aid i.e. behind-the-ear hearing aid (1), has an earpiece (10) for producing a sound signal (S), and a connector for outputting the sound signal. A sound tube (20) transports the sound signal between the earpiece and the connector. The sound tube is flexibly formed with a longitudinal middle section (22) in a direction, which is perpendicular to a longitudinal direction (L) of the tube. The tube and/or middle section are bent within the hearing aid in an assembled condition. The tube is made of plastic and/or the connector is made of metal or alloy. An independent claim is also included for a method for assembling a hearing aid.
