Abstract (en)
[origin: WO2008023304A2] An external defibrillator and method are described which enable a rescuer to administer epinephrine to a patient through transdermal injection controlled by the defibrillator. In one example a medicament injector is embedded in a defibrillation electrode. If attempts to resuscitate the patient through defibrillation are unsuccessful, the medicament injector is triggered from the controls of the defibrillator to cause the embedded injector to inject epinephrine into the skin of the patient. The injector may alternatively be attached to and controlled from the defibrillator independent of the defibrillation electrodes.
