Abstract (en)
[origin: WO2008025414A2] The invention relates to a method and a system for controlling and/or monitoring rail-borne vehicles, comprising: a) at least one signal cabin provided with a signal box computer, b) at least one component arranged along the track in the region of the rails, for the safety of the train, especially a signal, a marker, a loop cable, a leakage flux cable, and an axle counter, c) at least one component arranged along the track in the region of the rails, for adjusting the track, especially a point comprising a point drive, d) at least one decentralised adjusting part for adjusting the components for the safety of the train and the components for adjusting the track. The invention is characterised in that the components for train safety and the components for adjusting the track by means of the decentralised adjustment part associated therewith are coupled to the signal cabin computer by means of a data bus, and safety information is transmitted to the signal box computer or obtained therefrom according to a pre-determined protocol. A feeding bus which is logically decoupled from the signal box computer is provided for electrically feeding at least some of said components.
