Abstract (en)
[origin: WO2008025345A1] The invention relates to a device for a watercraft for picking up and launching boats. Said device comprises an extension arm that is coupled in such a manner that it can swing freely on the watercraft, that extends at an acute angle in relation to the surface of the water and floats in water by means of floats. Said extension arm comprises guide tracks for a boat retrieving device that is maintained on the extension arm in a longitudinally displaceable manner. Said boat retrieving device comprises a holding head that is articulated in a displaceable manner on a running part guided on the guide rails, about an axis that is horizontal and approximately transversal in relation to the extension arm. Said running part is connected to the drive means for longitudinally displacing the boat retrieving device. The holding head comprises at least one adjusting means that acts upon its adjusting movement about the horizontal axis.
