Abstract (en)
[origin: WO2008023042A1] The invention relates to a flood protection device comprising at least one cylindrical container (10), which can be filled with a ballast medium (2), wherein the at least one container (10) is made of a plate (11) bent into a cylinder and thus constituting the circumferential surface of the container (10), and wherein in the at least one container (10) a preferably sack-shaped insert (3) can be inserted, into which the ballast medium (2) can be filled. In order to be able to effectively prevent bloating of the cylindrical container (10), it is provided according to the invention that on a longitudinal side (13) of the plate (11), which forms the base region (13') of the cylindrical container (10) in the bent state, at least one lip arrangement (14) is disposed, which in the bent state of the plate (11) rests at least partially in the base area (G) of the container (10).
