Abstract (en)  
[origin: US2008040527A1] A management module that provides remote access and control of a computing device includes a keyboard, video and mouse (KVM) switch, a KVM over Internet Protocol (KVMoIP) module, and an Ethernet switch. It may also include a serial module and/or a microprocessor. The management module may be embedded in a circuit board such as a motherboard, daughterboard, baseboard or equivalent structure, of desktops, servers, notebooks, docking stations, personal digital assistants, and next generation phones or implemented as a dongle for connection to any of such devices. The management module provides out of band access by IT personnel and permits such persons to get full control of such equipped devices. Utilization of the modules enhances security, permits off peak hour maintenance, reduces downtime, and requires no end user involvement.
