Abstract (en)

[origin: EP2058262A1] The device (2F) has a brake module (6F) cooperating with a mechanism i.e. rail (16F), moving relative to the brake module, and a handle (4F) adjustable between two operating positions (36F, 38F). The handle is connected in the operating position (36F) with the brake module in such a manner that aerodynamic force is transferred from the handle to the brake module. The handle in the operating position (38F) is separated from the brake module such that the brake module is in contact with the mechanism. An independent claim is also included for a method for adjusting a brake module for a cabin moving relative to a lift shaft.
