Abstract (en)

[origin: WO2008024375A2] A respiratory muscle endurance training device (RMET) includes a chamber and a patient interface. In one implementation, one or both of a CO₂sensor or a temperature sensor can be coupled to the chamber or patient interface to provide the user or caregiver with indicia about the CO₂ level in, or the temperature of, the chamber or patient interface, and/or the duration of use of the device. In another implementation, the RMET may have a fixed volume portion adjustable to contain a measured portion of a specific patient's inspiratory volume capacity. Methods of using the device are also provided.
