Abstract (en)

[origin: WO2008028744A1] The invention relates to an ink dosing device (04) of a printing group (01) comprising a printing group cylinder (02) that is embodied as a plate cylinder (02) as well as an inking unit. The ink dosing device (04) has a number (m) of physical zones ( $Z_{P,i}$ ) which are arranged next to each other in the longitudinal direction and can be individually adjusted by means of dosing elements ( $D_{i}$ ) in order to individually adjust, section by section, an amount of ink that is to be applied. A control station (07) is provided with a number (n) of operator elements ( $B_{j}$ ) which are assigned to virtual zones ( $Z_{V,j}$ ) of a printed page and are used for triggering dosing elements ( $D_{i}$ ). The segmentation of the zones ( $Z_{V,j}$ ) of the ink dosing device (04) in relation to the width of the printed page differs in the number and/or position of the zones ( $Z_{V,j}$ ) of the ink dosing device (04) across the width (b) of the printed page (S) from the segmentation of the zones ( $Z_{V,j}$ ) in the control station (07) in relation to the width of the printed page with respect to the number and/or position of the zones ( $Z_{V,j}$ ) in said control station (07) across the width (b) of a printed page. At least two dosing elements ( $D_{i}$ ) are allocated using computing means to at least one of the operator elements ( $B_{j}$ ) with respect to the relevance of the latter for the adjustment process following the selection of said operator element ( $B_{j}$ ).
