Abstract (en)
[origin: WO2008028213A1] An apparatus (1) for discharging tablets (5, 5') into tablet carriers (2), for example blisters, has a tablet storage container (4, 14) for intermediately storing a multiplicity of tablets (5, 5') which lie loosely next to one another and above one another and at least one displaceable load receiving means (3, 13) for removing a single tablet (5, 5') from the tablet storage container (4, 14) and for transferring the received tablet (5, 5') onto the tablet carrier (2). Here, the load receiving means (3, 13) removes the tablet (5, 5') out of the tablet storage container (4, 14) from above. The load receiving means (3, 13) is configured for carrying out scanning movements above the tablet storage container (4, 14), wherein the scanning movements are executed either using predetermined curves (10) or in a manner which is controlled by a sensor (7) for detecting tablets.
