Abstract (en)

[origin: WO2008022737A1] A drive for rotational machines, having stationary and rotating machine parts, is to be improved such that it has a simpler and more inexpensive design, while maintaining the control and regulating accuracy, and at the same time is subject to less wear and tear and less prone to failure. This is achieved in that a ring around the periphery of a machine part is provided, the ring comprising a plurality of magnets (27, 37), and that at least one corresponding stator (28, 38), covering only a partial segment of the ring, is disposed on the other machine part such that the rotating machine part (23) can be put into a defined rotation by an electromagnetic field generated by the stator (28, 38).
