Abstract (en)

[origin: DE202006013229U1] The device has a pressure balancing value extending via a wall of a housing to enable inflow of air from the environment into an inner space (3) and to block the air discharge from the space. An opening is formed in a wall of the housing parallel to the valve and penetrable in two directions, where conductance of the housing is smaller than that of the valve in a penetrable direction and larger than a leakage conductance of the valve in a closing direction. A sealing-profile seals a gap between a door and the body in a groove of the door and extends the opening between the walls of the groove. The sealing profile has an anchor that intervenes in the groove.
