Abstract (en)

[origin: EP2061287A2] The method involves controlling the average power and the pulse duration independent of each other between two successive pulses of the microwave generator. The cooked degree of the cooked food such as internal cooked degree is determined particularly by a core temperature, a cook value, a pasteurization value or a reduction of weight. The external cooked degree is determined particularly by the browning and encrustation. An independent claim is included for a cooking appliance with a microwave generator, a control and regulating unit, operator controls, a storage unit and a sensor.
