Abstract (en)

[origin: WO2008031579A1] A state sensor (1) for plants has a clamping device (2) with two clamping elements for clamping a plant part (5). A plant parameter measuring device is mechanically coupled to the clamping device (2) and has a sensor element. The latter is designed as a pressure sensor element arranged on one of the clamping elements for recording a pressure state value of the plant which is independent of the displacement of the clamping elements relative to one another. An irrigation system has at least one such state sensor. This results in an uncomplicated reliable determination of the irrigation state over a prolonged period.
