Abstract (en)

[origin: WO2008020760A1] Method for brewing and serving of beer, where fermentation occurs at a self-produced pressure from the fermentation process, the pressure being controlled to approximately 1.8 bar and a temperature controlled to below 30 °C, in order for the beer to preserve/accept a part of its own CO<sub>2</sub>-production such that the beer gets a higher CO<sub>2</sub>-content than what is normal for a top fermentation process. The brewing and serving can be done by using the apparatus described below. Apparatus for brewing and serving of beer comprising a closed single vessel (10), an outlet unit (40) arranged with a float (42) and a weight (44) to secure that liquid is let out from a tapping zone (11), and a water spreading organ (31) arranged over a passage (26) in the bottom of the vessel (10) such that water being let in, is spread in order to obtain a close to optimal final mix of liquid mixture (13) in the vessel (10).
