Abstract (en)

The present invention provides a terminal system and a method for selecting an audio signal where the system is adapted to simultaneously display dynamic data content on various radio stations. The method explains a way of selecting a specific audio signal of choice from the display as per a user request. Each channel from a radio station is associated with an audio signal and a corresponding data signal. The terminal consists of means (1, 15) for receiving an audio signal and a corresponding data signal from plurality of channels and a display interface (6, 40) adapted for simultaneously displaying the dynamic content of several data signals received from the channels. The terminal further comprises a user input means (7, 35) adapted for selecting an audio signal. The means (1, 15) further comprises of a multiplexer (20) adapted to receive a plurality of audio signals as input and provide an audio signal output. The input means (7, 35) can accept a user request and select an audio corresponding to said request.
