Abstract (en)
[origin: EP2063576A1] A mobile IP communication system includes a home agent 1 and a plurality of foreign agents 6a-6c. The home agent 1 manages the location of a mobile node 4. The mobile node 4 transmits a location registration request to the foreign agent 6a. The foreign agent 6a transmits the location registration request to the home agent 1 via a path routed through a router R1, in accordance with a routing table. When there is congestion in the path routed through the router R1, the foreign agent 6a transfers the location registration request to the foreign agent 6b. The foreign agent 6b transfers the location registration request to the home agent 1.
