Abstract (en)

[origin: WO2007087736A1] The invention relates to a variable supporting platform (A) for a watercraft (WF), comprising at least one lifting and lowering mechanism (B) and a platform (2) which can be lowered or raised on one side by means of the independent lifting and lowering mechanism (B) such that a ramp is created. Rotary means (10) allow the platform (2) to be put in a slanted position. Additionally, the lowerable platform (2) can be axially retained at a defined distance from the stern (8a) of the watercraft by means of another telescopic platform (22) or actively with the aid of a pushing motor (26).
