Abstract (en)

[origin: WO2008034439A2] Disclosed is a mirror drive for a camera, particularly a medium-size camera, in which both a mirror and an auxiliary shutter have to be swiveled. In order to use a small number of parts for producing said mirror drive and keep the design of the mirror drive uncomplicated, a motor is used which comprises a coil (11) and a magnet system (12) and in which the auxiliary shutter is directly coupled to the coil (11) and the mirror (40) is directly coupled to the magnet system (12). Preferably, the magnet system (12) and the coil (11) are mounted so as to be pivotable about the same pivot (14).
