Abstract (en)

[origin: WO2008034862A1] Modern image processing systems for the postprocessing of X-ray images require a large number of input parameters and take a great deal of time. So that calculations do not need to be made sequentially for different sets of input parameters, parallel processors (12) are used, in which the same image processing program is executed in each case, but with different input parameters in each case. A large number of processed X-ray images is thus obtained, which in particular can also be displayed simultaneously. From the multiple processed X-ray images (24), a repeated postprocessing of a processed X-ray image (26) can take place by mixing.
