Abstract (en)

[origin: EP2065092A2] The device has a rotor-stator system arranged within a housing (1), where a rotor (21) of the rotor-stator system is equipped around its circumference with processing tools (24), which are radially opposed by stator tools (26) that are arranged stationary relative to the housing while maintaining a working gap. A stator blade is arranged at a circumferential section, where the circumferential section is divided into subsections in rotation direction using the stator blade. A processing path is arranged along the circumferential section that is subsequent to the rotation direction.
