Abstract (en)

[origin: EP2065655A2] It is the object of the present invention to create an articulated and automatic system, which allows the reduction of the primary energy consumption for room air-conditioning. Such objects are achieved by a device for automatic management and thermoregulation of central systems, that allows individual direct users, and only the users, in the most precise and absolutely democratic manner, to decide how the HVAC systems should operate, both in terms of operation duration and in terms of performance and yields. It is another object of the invention a complex method which allows the carrying out of the automatic room thermoregulation both by knowing the immediate weather data, and by the information obtained from the weather forecast, integrated with the user decision to restrict or, however, to regulate the primary energy consumption for the room air-conditioning, in respect to duration times of air-conditioning and expected room climate parameters.
