Abstract (en)

[origin: US2010036286A1] An apparatus, in particular a dental splint, for the measurement of occlusal forces in case of a terminal occlusion of teeth comprises at least one sensor which is arranged outside of an occlusion region of the apparatus. A system for the diagnosis or treatment of bruxism serves to determine the position or the size of occlusal forces on the apparatus. A method allows exact localization and quantitative determination of occlusal forces on the apparatus.
