Abstract (en)
[origin: WO2008029032A2] The present invention relates to a surgical apparatus for osteosynthesis, comprising a plate (2) provided with at least two holes and intended to join two bone parts, and a blocking sleeve (10) which is substantially of revolution and is intended to be screwed into one of the holes of the plate, said blocking sleeve having an axial orifice for passage of a pin to be screwed into one of the bone parts, wherein the lower part of the blocking sleeve has a slit along at least one of its radii, and the blocking sleeve and the associated hole cooperate by threaded engagement in order to block the sleeve in the hole when the sleeve is screwed into the hole.
