Abstract (en)

[origin: DE102006046489A1] The method involves connecting a light sensor with an interface entrance (5) of an operating unit (2). The interface entrance conserves a passive electronic or opto-electronic element for receiving an actively transmitted signal. A photo sensor, which is the passive element, transmits the actual value of brightness to the operating unit. The element is an acoustic sensor, a vibration sensor or a pressure sensor. The actively transmitted signal is an analogous signal or a digital signal. The passive element is a potentiometer. Independent claims are also included for the following: (1) a system for operating an illuminant (2) a method for wireless communication between two operating unit for an illuminant (3) a system for wireless communication between two operating unit for an illuminant.
