Abstract (en)
[origin: WO2008042323A1] A method of managing inventory of a printed circuit board assembly line provides an identifier on material to be used on the assembly line. The identifier is scanned with a portable hand-held device prior to machine set up. Based on the scan, a part number of the material is verified. Information is sent to the hand held device so as to instruct an individual associated with the hand held device to perform a specific task, with regard to the assembly line, as indicated on the hand held device
