Abstract (en)
[origin: EP2067916A1] The lock (1) has a spindle (13) intervening in a carriage (24) that is shiftable by rotating the spindle, where the carriage carries a retaining mandrel (28), which intervenes in a drilling (38) of a profile lock cylinder (9) in a fixing position. The spindle is axial-fixedly supported at a lock housing (2), and the mandrel runs parallel, and is spaced apart from the spindle. A spacer piece is attached to the spindle, and is drivingly connected with the spindle in an axially displaceable manner. The spacer piece penetrates a face plate rail (5), and has a tool contact (14).
