Abstract (en)

[origin: EP2067919A2] A lamellar window has an outer frame in which a number of lamellae are horizontally and rotatably mounted one over the other and together are joined to one other by an adjustment mechanism so that the lamellae can be opened in common and closed in common and back again. Within the frame (1) of the window is an additional closable ventilation device (4) actuated independently of the lamellae and is used in place of one lamella (2), and/or forms part of a lamella (2).
