Abstract (en)

[origin: EP2070598A1] The button has a distribution chamber communicated with a vent (6) that is formed in an activating body (1) for conveying liquid. The chamber has a distribution opening (8) that is formed on periphery of the button for lateral distribution of the conveyed liquid. An integral cap (9) is associated to the body whose upper wall (4) is arranged opposite to a lower wall (11) of the cap. A contact area (12) is formed on the lower wall in order to form the chamber between the upper and lower walls. An independent claim is also included for a liquid distribution system comprising a pump or a manual activation valve.
