Abstract (en)  
This invention relates to a wind lock device (200) for stabilizing a construction safety screen which comprises a net support (140) with a fundament (101) and a lever arm (102), which lever arm is pivotally connected to the fundament at a first end portion of the lever arm. The safety screen is operable between a folded state and an unfolded state with the lever arm unfolded a predetermined angle from the fundament. The wind lock device comprises a first bracket member (201) which is pivotally arranged at the lever arm. The wind lock device is further arranged to engage with the fundament of the net support in the unfolded state of the construction safety screen. The wind lock device comprises an operating member (205) arranged to allow lifting the first bracket member when folding the net support.
