Abstract (en)
[origin: EP2071539A2] The receiver switches an electrical device in cooperation with a radio transmitter such that switching impulse is transferred to a relay (10) over a switching circuit (IC1), which is integrated cooperatingly with a code switch (SW202). An output of the relay is associated with the electrical device. The switching circuit is programmed for shut-off after a preset time interval. An exciter (10-3) i.e. magnetic coil, of the relay is switched by connections (8, 9) of the switching circuit. A relay contact (10-2) supplies two different outputs of the receiver.
