Abstract (en)

[origin: EP2071998A1] An implement for manual washing of floors or flat surfaces in general. The implement (1) comprises a frame (2) composed of at least one first plate-like element (6) which defines with one of its faces, designed to be directed toward the surface to be washed, a first application region for a first cleaning fringe (4). The frame (2) is connected to a connecting element (9) which can be associated with a handle (3). The frame (2) comprises a second plate-like element (7) which is laterally adjacent to the first plate-like element (6) and defines, with its face designed to be directed toward the surface to be washed, a second application region for a second cleaning fringe (5). The second plate-like element (7) can move with respect to the first plate-like element (6) in order to pass from an active position, in which it is substantially coplanar and laterally adjacent to the first plate-like element (6), to an inactive position, in which it is spaced from the plane of arrangement of the first plate-like element (6) on the opposite side with respect to the face of the first plate-like element (6) that is designed to be directed toward the surface to be washed, and vice versa.
