Abstract (en)

[origin: EP2072159A1] The device has bending tools (27) movable opposite to bending cores (30, 31), where the tools press a component to be bended at the bending cores. The bending cores are arranged at bending slots (2) movable in an axis, and the bending tools are arranged at transverse slots (3, 4), which are movable in another axis transverse to the bending slots. The bending slots are movably guided at a console (1), and a servo drive controls the movement of the bending slots. The transverse slots are movably guided at a transverse carrier, which is arranged transverse to a movement axis of the bending slots.
