Abstract (en)

[origin: EP2072252A2] The method involves compensating a regulation-related lag by a contouring error between a target rotation angle position and an actual rotation angle position of a plate cylinder (1) during swiveling of a rubber cylinder (2) to the cylinder (1). The cylinder (2) is swiveled by shifting a transmitter support point (8.1) from another point (8.0), which provides a rotation angle-asynchronicity of the engaged cylinder (2) without considering regulating errors. The lag is compensated such that cylinder surfaces are separated from each other at a moment of touching in a synchronous position. An independent claim is also included for an arrangement for a turning angle transmitter.
