Abstract (en)

[origin: EP2072272A2] The transport device comprises a quantity on distance pieces (203,204,206) on one side between an end of a bearing plate (22) of a roll carrier and a molding plate (211). A clamping unit (225) is fixed on the end of the bearing plate of the roll carrier and is formed for power transmission from a connecting rod (221). A mechanical tensile stress is transferred by the clamping unit on both the ends of the bearing plate for defined deflection of the roll carrier during corresponding loading of the bearing plate.
