Abstract (en)

[origin: EP2072416A1] The container (1) has a reservoir (10) with a filling orifice and a closing element e.g. cap (30). The cap closes the filling orifice, and gripping units (20) permit positioning of the cap in a filling position of the reservoir, near the filling orifice, in which the gripping units are adapted to permit displacement of the closing units (30) from one position to another position to close the filling orifice. The gripping units are present in the form of a ring connected to a neck of the reservoir with a breakable element. An independent claim is also included for a method for filling a container with liquid.
