Abstract (en)

The object of the present invention is a diagnostic and maintenance tool for lifts (1) which permits different diagnostic and maintenance tools to be combined by using a PDA (2) or similar tool, as this enables a Bluetooth communication to be established between the different pieces of lift equipment to be diagnosed and the PDA (2) or similar terminal, where the equipment may be the lift control system, the speed regulator or any lift electronic subsystem, irrespective of whether or not it is provided with a Bluetooth connection, in such a way that representation of the information is improved, in addition to making the operations carried out by maintenance and set up more simple, fast and effective as the terminal incorporates elements which permit communications to be established with the different equipment at a physical level, as well as handling the various communication profiles used.
