Abstract (en)

[origin: WO2008046417A2] A closure for a pressurized container is provided with sound-producing means. The aim of the invention is to provide an inexpensive closure for conventional drink containers which is capable of producing various sounds. For this purpose, the closure is partly produced from a brittle material that is deformed together with the closure when the closure is opened and produces a sound. The closure according to the invention is suitable for bottles that are closed with crown caps, a disk produced from a brittle material being glued onto a conventional crown cap.
