Abstract (en)

[origin: EP2074903A1] The case has an outer displacement mechanism for displacing an outer applicator i.e. hollow outer stick (1), between a retracted position in an upper body (3) of the case and a projection position of the body. An inner displacement mechanism displaces an inner applicator i.e. inner stick (2), with respect to the outer applicator. The mechanisms are rotatively activated by rings (4, 5), respectively, where the rings are rotatively mounted with respect to the body. Each mechanism is arranged for independently moving the corresponding applicators in different positions.
