Abstract (en)
The guide has an insertion unit (25) with a stop moved with a tilting slide in a longitudinal direction of a carcass rail during displacement of the tilting slide between starting- and end positions. The stop co-operates with another stop of a middle rail running between an extending rail (6) and the carcass rail in a differential manner. The latter stop runs to the former stop before an actuator stays in engagement with the tilting slide. The latter stop releases the tilting slide from a tilted end position and is moved in a direction to the starting position.
