Abstract (en)
[origin: WO2007135190A2] The invention relates to a pair of tongs (1) with two tong limbs (2, 3) which are connected rotatably to each other in a joint in which they are inserted and which has an axially fixed joint pin (7), wherein the tong limbs (2, 3) are only rotatable with respect to each other, and a working region (4) and a handle region (5) are formed in each case on one tong limb (2, 3), and a receiving tong limb (3) is designed with an insertion slot (6) which has a slot width (s) in the region of the joint and through which the other inserted tong limb (2) is inserted, wherein, furthermore, the working regions (4) of the tong limbs (2, 3) have a greater width (b), at least in part, than the slot width (s). In order to make production economic with the stability being as good as possible, the invention proposes that the handle region (5) of the inserted tong limb (2) has a width (B) and, if appropriate, a thickness which corresponds to the slot width (s). With regard to great freedom in the geometrical design of a handle limb, the invention also proposes that the handle covering has a reinforcing element.
