Abstract (en)
[origin: WO2008051146A1] In a hydraulic impact device an impact piston (12) is reciprocated in a cylinder bore (10) and has a central drive portion (20) energised in an activation section (16) of the cylinder bore (10), and a forward end portion (23) and a rear end portion (25) of the impact piston (12) form clearance seals (24,26) visavi the cylinder bore (10), and at the ends of the cylinder bore (10) there are provided low pressure chambers (34,35) which together with a communication passage (36) form a low pressure circuit which is continuously connected to the tank (28). The low pressure chambers (34,35) at the ends of the cylinder bore (10) enables the impact piston (12) to be sealed off by clearance seals only, whereby piston leakage is prevented without the use of seal rings.
