Abstract (en)

[origin: DE102006046669A1] The commutator (1) has contact segments (9), dissociated from each other, forming a commutator surface (8). Each of the segments is soldered with a mounting section of a metallic segment support part (4). The segment is provided with a hub body (3), made of an electric insulating material, which carries the support parts, dissociated from each other. The support part is provided with a coil connection hook. A solder barrier recess is brought in a facing upper side in one of the contact segments of one of the mounting sections. An independent claim is also included for a circular press bent part for producing a commutator.
