Abstract (en)
[origin: EP2077165A1] The machine has hydraulically or pneumatically driven form templates (3) arranged at a side, which is opposite to the form templates, of a metal sheet (B), to bend the metal sheet into a contour, which is adjusted by forming tool templates (1). Actuators are designed as a servo-jack (2) and the form templates are arranged in a row within an area of end sections of the metal sheet bordering at edges of the metal sheet. A clamping device (10) is provided for the metal sheet, which is arranged parallel to a row of the tool templates that are isolated from the metal sheet edges.
