Abstract (en)  
[origin: EP2077571A1] The contactor has a magnetic circuit with a fixed part (3) fixed with respect to a magnetic field generating coil (2), and a mobile part (4) fixed with respect to the coil by using an action of magnetic field delivered by the coil. The coil forms a winding around an axial passage (12) in which the mobile part is displaced. A voltage interruption and dips holding unit has a flange (13) that is extended around an opening (7) from a wall towards an interior of a housing, so that the flange is exterior to the axial passage defined by the winding of the coil.
