Abstract (en)

[origin: WO2008042849A2] A method includes receiving at least one of a widget or a reference to a widget, where the widget can be at least one of a static data object, a media object, or a software object. At least a portion of a widget container, which is a procedural software framework containing a service module associated with the widget and the widget, is generated. The service module can be a pre-defined function associated with the widget container before the widget container is generated. The widget container can be configured to be executed at a widget-container processing device in response to a reference to the widget container being accessed from a processor-readable vehicle.
