Abstract (en)
[origin: EP2080502A1] The blister pack arrangement has a blister pack, which has a cavity (7) for receiving a medication dosage and a closure film. Each medication dosage is squeezed out through the closure film by pressing out the respective cavity for sampling. A conductive path carrier is aligned relative to the cavities of the blister pack such that a conductor (1) is disconnected within the surface by pressing out the medication dosage. The surface is defined by perpendicular projection of the cavity on the conductive path.
